

Prior Work Communication Record

Independent StratML (ISO 17469-1) Schema Mapping of AI Governance Definition Article

Date Discovered: March 18, 2026

Classification: Independent third-party structural validation (unsolicited)

Evidentiary Value: Prior art support; demonstrates operational specificity of AI Governance definition sufficient for formal ISO schema decomposition

Third-Party Action

Name: Owen Ambur

Email: Owen.Ambur@verizon.net

LinkedIn: <https://www.linkedin.com/in/owenambur/>

Credentials: Chaired the committee that specified Strategy Markup Language (StratML) Part 1, Strategic Plans, as ISO 17469-1 (published 2015). Chaired development of Part 2, Performance Plans and Reports (ANSI/AIIM 22:2017). Retired federal government standards professional.

Action Taken: Without solicitation, Owen Ambur decomposed the AI Governance Definition article into a formal StratML Part 1 (ISO 17469-1) strategic plan schema and published it as a publicly accessible XML document.

Published Date: 2026-03-18

Period Covered: 2026-03-15 to ongoing

Discovery Method: Owen commented on the original LinkedIn post linking to the StratML artifact. No prior relationship or communication existed between Basil C. Puglisi and Owen Ambur before this comment.

Significance for Prior Art Record

This constitutes independent third-party structural validation from an ISO standards committee chair. The mapping demonstrates that the AI Governance definition proposed in the article is structurally specific enough to survive formal decomposition into an international standard schema (ISO 17469-1). This is not an endorsement or opinion. It is an architectural test: content that maps cleanly into a formal schema possesses operational specificity. Content that does not map cleanly remains abstract.

The five-goal structure Owen produced accurately captures the article's core claims:

Goal 1, Definition: The field lacks a formal definition; the article proposes one grounded in decision authority and accountability.

Goal 2, Framework Alignment: The definition integrates across ISO, NIST AI RMF, EU AI Act, OECD, and UNESCO frameworks.

Goal 3, Accountability: Governance requires enforceable accountability through moral, employment, civil, and criminal channels.

Goal 4, Distinction: AI Governance is structurally distinct from Responsible AI and management systems.

Goal 5, Operational Test: Three criteria determine whether governance exists in practice: named individual, traceability, and accountability channels.

The governance threshold (Goal 4, Objective 4.2) preserves the article's central claim: named human accountability at defined checkpoints is the boundary between governance and process.

Full StratML Artifact Content (Preserved)

Title: AI Governance Definition & Accountability Framework

Description: A plan to establish a unified definition of AI governance grounded in decision authority, accountability, and enforceable oversight mechanisms.

Organization: AI Governance Ecosystem (AIGE): Institutions, organizations, and individuals responsible for defining, implementing, and enforcing AI governance.

Stakeholders:

Basil C. Puglisi: Author proposing a formal definition of AI governance grounded in accountability and decision authority.

Standards Organizations: Entities such as ISO responsible for governance and management system standards.

Regulators: Authorities establishing binding obligations for AI systems.

Vision: Clearly defined AI governance enabling accountable human oversight of AI systems across all institutional contexts.

Mission: To establish a unified definition of AI governance grounded in decision authority, accountability, and enforceable oversight mechanisms.

Values:

Accountability: Ensure identifiable individuals are responsible for AI decisions and outcomes.

Authority: Assign decision-making power to qualified individuals with the ability to approve, modify, or halt AI outputs.

Transparency: Enable traceability and auditability of decisions affecting AI outputs.

Responsibility: Align AI use with ethical, legal, and societal expectations.

Clarity: Define governance concepts unambiguously across institutional contexts.

Goal 1: Definition

Establish a clear and unified definition of AI governance across institutions and frameworks.

Objective 1.1 Conceptual Definition: Define AI governance as decision authority, accountability structures, and oversight mechanisms exercised by named humans.

Objective 1.2 Applied Definition: Specify governance as the presence of a qualified human with binding authority and accountability at defined checkpoints.

Goal 2: Framework Alignment

Integrate governance concepts across institutional frameworks and standards.

Objective 2.1 Accountability Structures: Incorporate accountability and decision authority as defined in organizational governance standards.

Objective 2.2 Human Oversight: Ensure alignment with principles requiring human responsibility and oversight of AI systems.

Objective 2.3 Risk Posture: Embed governance within organizational culture and risk management practices.

Goal 3: Accountability

Ensure governance includes enforceable accountability for AI outputs.

Objective 3.1 Decision Authority: Assign binding authority to individuals to approve, modify, or halt AI outputs.

Objective 3.2 Auditability: Enable tracing and review of decisions affecting AI outputs.

Objective 3.3 Liability Channels: Ensure accountability through moral, employment, civil, and criminal mechanisms.

Goal 4: Distinction

Differentiate AI governance from responsible AI and management systems.

Objective 4.1 Responsible AI: Define responsible AI as engineering practices embedding ethical principles into systems.

Objective 4.2 Governance Threshold: Establish the requirement of named human accountability as the threshold for governance.

Goal 5: Operational Test

Provide criteria for determining whether AI governance exists in practice.

Objective 5.1 Named Individual: Identify a specific person with authority over AI outputs.

Objective 5.2 Traceability: Ensure decisions can be documented and reviewed.

Objective 5.3 Accountability Channels: Confirm applicability of moral, employment, civil, or criminal accountability.
